SECTION 1 · PLANNING

Development timeline

Five-week sprint from kickoff to pitch

Phase 1 Foundation	Phase 2 Build phase 1	Phase 3 Integrate	Phase 4 Polish & reflect	Phase 5 Rehearse & deliver
Hafiz Kickoff · drive · brief · assumptions log opened Tianne + Hafiz Research the 4 trends · early persona sketches Terry + Kassandra Pick AI builder (Wix / Canva / Zyro / Framer) Alex Moodboard · visual identity direction Krystal + Kaiming Wellness benchmark scan · pitch outline v1	Alex Homepage + 2 key pages live on builder Tianne + Hafiz Product dataset · personas with quotes · lit review for reflection started Kassandra Benefit-led recommender logic prototype Terry Data structure · API mocks · MVP scope locked Krystal Engagement components: chat, reviews, AMA designs	Alex + Terry + Kassandra Recommender integrated into live site Krystal + Alex Engagement features wired into product pages Tianne A/B test one design choice · pull stats Hafiz Personas finalised · assumptions doc closed Kaiming Begin populating deck with team outputs	All Internal review · fix top 5 issues Hafiz Finalise GenAI critical reflection section Kaiming + Tianne Screenshots · short demo clips Krystal Engagement story polish · sample UGC Kaiming Full deck assembled with all content	Mon Dry run #1 — full team, full deck Tue–Wed Edits on feedback · timing tightened Thu Dry run #2 — invite a friendly outsider Fri Pitch · own the Q&A · log learnings
Decision gate at end of week 1: confirm AI platform · confirm online-store path is locked				

Section 2 — the pitch

Brighten everyday wellness.

An AI retail experience for Unilever's health & wellbeing line

[ADD: Team name · course code · presentation date]

AGENDA

What we'll cover today

01 The opportunity

Why Unilever is launching a health & wellbeing line now

02 Who we're designing for

Three consumer archetypes from our research

03 The platform

An AI-driven online store, walked through end to end

04 How we built it

AI tools used, choices made, what we'd do differently

05 Reflecting on GenAI

Benefits, risks, and what it means for human roles in retail

06 Limits & next steps

What our prototype doesn't cover, and how we'd scale it

Four Trends. Four Design Decisions.

Every feature of our platform maps directly to a Unilever H&W consumer trend

Lifestyle Goals

"Health is a lifestyle goal, not the absence of illness"

Benefit-led navigation replaces product categories entirely. Shoppers browse by outcome and not by ingredient or brand.

Rationale: Goal-framing increases dwell time and reduces decision fatigue (Huntsman & Bulaj, 2023)

Benefit Personalisation

"From one-size-fits-all to personalisation based on benefits"

AI recommender reads goal + browsing + dietary tags to build a personal wellness mix that is unique to every shopper.

Rationale: DNCF recommendation precision = 0.85 (Messaoudi & Loukili, 2024)

Category Overlap

"Supplements, beauty, personal care, foods - increasingly integrated"

'Boost Immunity' shelf surfaces a vitamin, a probiotic food, a skincare SPF and a sleep tea: one wellness story, not four aisles.

Rationale: Cross-category baskets increase average order value and reinforce lifestyle identity

Sense of Community

"Conscious consumers foster a sense of community and shared lifestyle"

Goal-based forums, verified peer reviews, lifestyle AMAs and habit nudges turn one purchase into an ongoing shared routine.

Rationale: UGC drives +41–75% conversion uplift (Kahfi & Suyuthi, 2024)

Discover. Decide. Purchase. Belong.

Every touchpoint is AI-powered; every stage maps to a Unilever H&W trend

AI Tools, Placement & Personalisation

How AI website builders, recommendation engines and interactive features drive engagement

AI Website Builders

We chose Wix ADI because it lets non-developers build and iterate a fully responsive storefront in hours — freeing the team to focus on strategic layout decisions, not code.

- Wix ADI auto-generates layout from brand inputs
- Canva Websites: drag-and-drop + AI content suggestions
- Zyro AI: real-time copy generation for product pages
- Enables rapid, low-cost storefront prototyping

Tool focus: Wix ADI · Canva Websites

Benefit-Led Product Placement

We chose benefit-led shelves because goal-framing reduces decision fatigue and increases basket size by surfacing complementary products across traditional category lines.

- Group by outcome, not category (e.g., 'Boost Immunity')
- Cross-promote supplements + beauty + foods together
- AI recommendation precision: 0.85 (Messaoudi & Loukili, 2024)
- Reduces friction in the discovery journey

Source: Messaoudi & Loukili (2024)

Interactive AI Features

We chose chatbot + recommender because 24/7 AI assistance covers browsing hours when human teams are offline, and personalisation at scale is impossible manually.

- Chatbot assistants: 24/7 personalised health guidance
- Virtual try-on: AR-based product visualisation
- AI recommendation engines: collaborative filtering
- Live chat + community forums for lifestyle engagement

Source: Prasanna & Kushwaha (2025)

Trust, Community & Empowerment

The social layer that turns a transaction into a lifestyle

USER-GENERATED CONTENT AS CONVERSION DRIVER

- UGC implementation → +41–75% conversion rate uplift (Kahfi & Suyuthi, 2024)
- Star rating = #1 trust attribute; outweighs price & brand name (Sung et al., 2023)
- Negative UGC requires active moderation as unmanaged reviews reverse gains

EMPOWERMENT MARKETING FOR HEALTH & WELLBEING

- Frame products as tools for lifestyle outcomes, not just purchases
- Positive-gain messaging outperforms risk-avoidance framing (Huntsman & Bulaj, 2023)
- Channels: social media, podcasts, connected TV, digital storytelling

TIKTOK & INSTAGRAM: ENTERTAINMENT BEFORE CONVERSION

- SOR model: entertainment + celebrity = flow experience elicits purchase (Jiang et al., 2024)
- AIDA framework maps Attention, Interest, Desire, Action on social platforms
- Live streaming + short-video content drives Gen Z health product discovery

"92% of consumers trust peer content over brand advertising"
Kahfi & Suyuthi (2024)

Generative AI: Benefits, Challenges & Human Roles

Prasanna & Kushwaha (2025) · Schröder et al. (2025) · Handoyo (2024)

BENEFITS	CHALLENGES	HUMAN ROLES EVOLVE
• Scalable, low-cost content creation • Real-time campaign personalisation • Chatbot-driven 24/7 customer service • Dynamic product recommendations at scale • Faster A/B testing of promotional assets	• Consumer scepticism toward AI-generated content • Privacy & data governance risks • AI health claims → regulatory exposure (FTC/ASA) • Negative UGC amplification if moderation fails • ROI of health marketing: inconclusive (Huntsman & Bulaj, 2023)	• Content creators → strategy & curation • Analysts → focus on insight interpretation • Customer agents → complex/sensitive cases • New role: AI Orchestrator — design, govern, align • Human oversight non-negotiable for health claims

"The most effective AI integrations augment human creativity — they do not replace it."

Financial:	High upfront AI costs; lower marginal content costs at scale
Strategic:	Human-AI collaboration outperforms full automation
Ethical:	Transparent AI disclosure essential in health & wellbeing retail

02 · WHO WE'RE DESIGNING FOR

Three shoppers, three jobs to be done

Built from our user research — fill in detail per persona

THE OPTIMISER

Persona 1

Age & life stage

[e.g. 32, lives in London]

Goal

[1-line wellness goal]

Frustration

[what they can't find today]

Quote

[short verbatim from research]

THE NEW PARENT

Persona 2

Age & life stage

[e.g. 32, lives in London]

Goal

[1-line wellness goal]

Frustration

[what they can't find today]

Quote

[short verbatim from research]

THE RESET-SEEKER

Persona 3

Age & life stage

[e.g. 32, lives in London]

Goal

[1-line wellness goal]

Frustration

[what they can't find today]

Quote

[short verbatim from research]

03 · THE PLATFORM

Discover. Decide. Belong.

Three jobs the platform does for every shopper

Discover

Benefit-led navigation and an AI recommender that mixes categories

Powered by personalisation engine

Decide

An AI Q&A assistant that answers in plain English, not marketing speak

Powered by the chatbot layer

Belong

Reviews, lifestyle content and community threads tied to shared goals

Powered by engagement features

[ADD: 1-line tagline that ties the three pillars to Unilever's brand promise]

03 · THE PLATFORM

We replaced shelves with goals

Category overlap, made browsable

Old shelves

Supplements · Beauty · Personal care · Foods

New shelves

Boost immunity	Glow naturally
Wind down	Feel strong
Reset & cleanse	Energise

Each shelf blends products across Unilever's traditional categories — exactly the overlap trend the H&W line was built around.

03 · THE PLATFORM

The recommender in action

One goal in, a personal mix out — across categories

01

User picks a goal

"I want to boost my immunity going into winter."

02

AI builds a personal mix

Reads goal + browsing + season + dietary tags.
Surfaces complementary products.

03

Cross-category basket

A vitamin, a probiotic food, a skincare SPF, a sleep tea — one wellness story.

PLACEHOLDER

Screenshot — example recommendation strip for "boost immunity"

Kassandra to drop in: 4–6 product tiles from the live recommender · captioned with why each was picked

03 · THE PLATFORM

Plain-English Q&A, on tap

The chatbot answers questions a label can't

Customer

I'm exhausted but I can't fall asleep at night. What helps?

Wellness assistant

That's a stress-sleep loop — cortisol stays high in the evening. Two things often help together: a magnesium supplement an hour before bed, and a calming tea routine to break the spiral.

Want me to pull a starter pair from our range?

Why this matters

It explains, doesn't just sell

The assistant connects symptoms to mechanisms before recommending products. Builds trust and reduces returns.

It blends categories naturally

A supplement + a tea is one suggestion, not two from different aisles — mirroring the H&W line's cross-category strategy.

[ADD: 1 stat from Tianne's A/B test — e.g. 'in our small test, X% preferred this over a static product page']

03 · THE PLATFORM

From transaction to belonging

Engagement features that turn one purchase into a routine

Goal-based communities

Public threads grouped by goal — peer encouragement that ad budget can't buy.

Real reviews, verified

Reviews tagged with the customer's goal and skin/dietary profile for relevance.

Lifestyle blog & AMAs

Editorial content + expert AMAs that earn returning sessions, not just orders.

Virtual try-on previews

AR-style routine previews — see your morning before you check out.

Habit nudges

Opt-in reminders that link products to the moment they matter most.

Personalised feed

Homepage learns over time — yesterday's purchase informs tomorrow's surfacing.

04 · HOW WE BUILT IT

The AI stack behind the platform

Tools chosen for speed, swappable for production

SITE BUILDER

[ADD: Wix ADI / Canva Websites / Framer]

Visual identity, page templates, responsive layout

Owner: Alex

RECOMMENDER

[ADD: GPT-4 API / custom logic]

Goal-based product matching, cross-category mixing

Owner: Cassandra

CHATBOT / Q&A

[ADD: tool name]

Symptom-to-product reasoning, plain language

Owner: Cassandra

DATA LAYER

[ADD: dataset & format]

Curated SKUs with benefit tags, ingredients, claims

Owner: Terry + Tianne

[ADD: 1 sentence on what we'd swap for a production version — e.g. 'move recommender off API to a fine-tuned model']

05 · REFLECTING ON GENAI

What GenAI gave us

Honest read on where it added genuine value in our build

Personalisation at scale

A single recommender served every persona — work that would have been three separate static flows last year.

Always-on customer service

The chatbot covered evening browsing hours, when a human team would be off the clock.

Faster design iteration

AI site builders let us reshoot a page in an afternoon, freeing time for the strategic choices.

Content generation on tap

Product descriptions, blog drafts and persona quotes generated in minutes, then human-edited.

05 · REFLECTING ON GENAI

What it didn't fix — and what it changed

Challenges we hit, plus how human roles in retail are shifting

Challenges

Hallucinations

Chatbot confidently invented an ingredient claim once — needs guardrails on health language.

Bias in training data

Recommender skewed toward products with more reviews — i.e. toward bestsellers.

Brand voice drift

Generated copy reads generic without strong human editing pass.

Energy & cost at scale

Real-time API calls would be expensive at production traffic; needs caching strategy.

Human roles, recast

Curators, not creators

Copywriters move from drafting to editing — more output, sharper voice.

Ethics in the loop

New role: someone owns flagging hallucinations and bias in customer-facing outputs.

Strategists over technicians

Less time on layout, more on what the brand should actually mean to customers.

Data fluency for everyone

Marketers need to read a recommender's logic, not just look at click-through.

06 · LIMITS & NEXT STEPS

What our prototype doesn't cover

Honest scope and where we'd take it next

Assumptions

- Single market (UK) for personas and pricing
- Unilever H&W SKUs only — no third-party brands
- Recommender served at demo scale, not production
- Health claims would need regulatory review before launch

Limitations

- A/B test had a small sample — directional, not significant
- No accessibility audit (WCAG) yet
- Mobile experience is responsive but not native
- Chatbot relies on a base model — no fine-tune

Next steps

- Quantitative test with 100+ shoppers
- Multilingual rollout for EU markets
- Native iOS / Android wrappers
- Move recommender to a fine-tuned model

Thank you.
